ASCENDA ENTERPRISE CAPITAL LLC

AECQS Controlled: Hypothetical Results Summary

STATUS: ACTIVE RESEARCH & DEVELOPMENT. Updated 12 October 2026. Figures are hypothetical, are revised as research continues, and will change.

Hypothetical backtest, September 2012 – September 2026, modeled $25 million starting balance, net of modeled costs. A systematic multi-strategy futures research configuration. Not audited. No live or paper track record exists. Not an offer or solicitation.

Ending value from $25M, drawdown limit 16%

Case	Ending value (median of 4 walk-forward settings)	CAGR	Worst of the 4 settings	Max closed-day DD
Conservative: execution costs 33% above the central model	$1.5B	34%	about $1.05B	within -16%
Central: modeled costs	$1.8B - $2.0B	36 - 37%	about $1.2B - $1.4B	within -16%
Lower-cost target: about 13% lower execution costs (not verified)	$2.3B - $2.8B	38 - 40%	about $1.5B	within -16%

The central case is quoted as a range rather than the best single run because about 40 volatility-sizing variants were tested; a first-half/second-half check supports the approach (71% of 48 tested configurations beat the unsized version in the second half) but the exact figure is not claimed.

Income view: constant capital, profits withdrawn (unlevered, central cost)

Capital	Income per year	Per month	Return on capital	Worst drawdown on capital
$25M	$8M	$0.7M	32.6%	-8.6%
$50M	$15M	$1.2M	29.5%	-8.9%
$100M	$26M	$2.2M	25.8%	-8.8%
$200M	$46M	$3.8M	22.8%	-10.7%
$300M	$64M	$5.3M	21.2%	-10.5%
$400M	$77M	$6.4M	19.4%	-11.0%
$500M	$90M	$7.5M	17.9%	-11.4%
$600M	$102M	$8.5M	17.0%	-12.4%

Return on capital declines as capital grows because of market-impact and capacity limits. Median of four walk-forward settings; bundle only; the opening-drive and livestock sleeves and any leverage are excluded from this table.

What the configuration contains

A rebuilt multi-strategy futures bundle; an NQ opening-drive sleeve; a short-horizon livestock sleeve; slow volatility-based de-risking (VIX 21-day average, never adds size); and a 16% closed-day drawdown limit. Settings are selected on prior data only (anchored walk-forward). About 380,000 strategy tests across 47 futures markets were run with shifted-signal placebo controls; only the NQ opening drive and a capacity-limited livestock effect survived as additions.

Limitations

Costs are modeled, not measured from live fills. The lower-cost case assumes execution costs about 13% below the central model and has not been verified. Capacity, margin, market impact and intraday liquidation feasibility are not verified; the equity universe carries survivorship-bias risk. Results depend on the selection process described above and on the 2012–2026 history. Actual results would differ and could involve total loss. Verification plan: log real fills

(timestamp, size, slippage versus arrival price) and compare with the model before any cost claim is relied on.

HYPOTHETICAL PERFORMANCE — NOT ACTUAL TRADING. Simulated backtest results, net of modeled costs, prepared with the benefit of hindsight; not audited; not investor returns or assets under management. Hypothetical results have inherent limitations; no representation is made that any account will or is likely to achieve similar results. Nothing herein is an offer or solicitation.
